

“BEING READY FOR AUTOMOTIVE SECTOR IN WORLD”

The world is moving towards the Electric Vehicle (EV) mobility. Because of electric vehicles, the emission department of many companies are going to shut down. Before you start your career, think about the future of the automotive sector's innovation & upgrade yourself accordingly. Currently, I'm working as a die design engineer for soft components like car roof headliners, carpet and parcel trays.

These design of components is totally depends on new car production. When original equipment manufacturer (OEM)

start a new project it requires more than 3 to 4 years to design, test & launch to market. If you want to start your career in die design better start in sheet metal dies making, injection molding, and these companies get automotive parts, home appliances parts, all plastic parts etc.

Product development & vehicle testing profile is also good as growth is very fast in these sector. Choose your job profile wisely, which will not affect by the electric mobility world.
